-!- FUNCTION: THIS SMALL UBIOUITOUS ENZYME IS ESSENTIAL FOR MAINTENANCE AND CELL GROWTH.

-!- CATALYTIC ACTIVITY: ATP + AMP = ADP + ADP.

-!- SUBGELLIAR (BY SIMILARITY).

-!- SUBCELLIAR LOCATION: CYTOPLASHIC.

-!- SIMILARITY: BELONGS TO THE ADENYLATE KINASE FAMILY.

I. Biol. Chem. 271:1857-1860[1996].

MAY BE INVOLVED IN INHIBITION OF GASTRIC ACID SECRETION, MODULATION OF NEUROTRANSMITTER RELEASE IN CENTRAL AND PERIPHERAL NEURONS, INHIBITION OF SODIUM AND WATER REABSORPTION IN KIDNEY THIS RECEPTOR CAN COUPLE TO BOTH THE INHIBITION OF ADENYLATE C CYCLASS MEDIATED BY G-I PROTEINS, AND TO AN ELEVATION OF ADENYLATE C CYCLASS MEDIATED BY G-I PROTEINS, AND TO AN ELEVATION OF DIFFERENT SECOND MESSENGER SYSTEMS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.

ALTERNATIVE PRODUCTS: AT LEAST THREE ISOFORMS; ALPHA (SHOWN HERE),
BETA AND GAMMA; ARE PRODUCED BY ALTERNATIVE SPLICING. THEY HAVE
IDENTICAL LIGAM BINDING PROPERTIES BUT DIFFERENT COUPLING
PROPERTIES WITH G PROTEINS; ALPHA AND BETA COUPLE TO G-I PROTEINS,
WHEREAS GAMMA COUPLES TO WULTIPLE G-PROTEINS, G-I AND G-S. ALPHA
SHOWS HIGH AGONIST-INDEPENDENT CONSTITUTIVE INHIBITION OF
ADENYLATE CYCLASE, WHILE BETA HAS NO AGONIST INDEPENDENT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          IRIE A., SUGIMOTO Y., NAMBA T., HARAZONO A., HONDA A., WATABE A., NEGISHI M., NARUMIYA S., ICHIKAWA A.;
"Third isoform of the prostaglandin-E-receptor EP3 subtype with different C-ferminal tail coupling to both stimulation and inhibition of adenylate cyclase.";
Eur. J. Blochem. 217:313-318(1993).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PTM: LIGAND BINDING IS AFFECTED BY CAMP-DEPENDENT PHOSPHORYLATION

bin/display?db-wormace&class=Sequence &object=F14B6
current sequence finishing criteria for the C. elegans genome
sequencing consortium are that all bases are either sequenced
unambiguously on both strands, or on a single strand with both a
dye primer and dye terminator reaction, from distinct subclones.
Exceptions are indicated by an explicit note.
IMPORTANT: This sequence is NOT necessarily the entire insert of
the specified clone. It may be shorter because we only sequence
overlapping sections once, or longer because we arrange for a small
impoRTANT: This sequence is not the entire insert of clone F14B6.
It may be shorter because we only sequence
overlapping sections.
It may be shorter because we arrange for a small once, or longer because we only sequence
neighbouring submissions.
The true left end of clone F41D3 is at 29177 in this sequence. The
true right end of clone F41D3 is at 19221 in this sequence. The
start of this sequence (1. .109) overlaps with the end of sequence
                                                                                                                                                                                                                                                                                                                             Caenorhabditis elegans.

on Aug 10, 1999 this sequence version replaced g1:4938508.

Order of segments is not known; 800 n's separate segments.
IMPORTANT: This sequence is unfinished and does not necessarily
represent the correct, sequence. Work on the sequence is in progress and the release of this data is based on the understanding that the sequence may change as work continues. The sequence may be contaminated with foreign sequence from E.coli, yeast, vector,

on Sep 12, 1999 this sequence version replaced gi:5777438.
IMPORTANT: This sequence version replaced gi:5777438.
IMPORTANT: This sequence is unfinished and does not necessarily
represent the correct sequence. Work on the sequence is in progress
and the release of this data is based on the understanding that the
sequence may change as work continues. The sequence may be
contaminated with foreign sequence from E.coli, yeast, vector,
phage etc. Order of segments is not known; 800 n's separate
segments. Unfinished: dJ1141E20 Contig_ID: 00340 acc-AL109912
Length: 64235 bp Unfinished: dJ1141E20 Contig_ID: 00679

E-mail enquiries: humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk clonerequest@sanger.ac.uk clonerequest@sanger.ac.uk clones.com com Sep 6, 1999 this sequence version replaced gi:5791529.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with the following abbreviations are used to associate primary accession
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DNA PRI 23-NOV-1999 clone 1112D6 on chromosome 6q21-22.2,

numbers given in the feature table with their source databases:
Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information
on the WORMPEP database can be found at
http://www.sanger.ac.uk/Projects/C_legans/wormpep This sequence is
the entire insert of clone 1112D6. This sequence has been finished
according to sequence map criteria as follows. An attempt is made
to resolve all sequencing problems, such as compressions and
repeats, but not necessarily within known annotated human repeat
sequence elements (e.g. Alu). Where the sequence is ambiguous,
there is an annotation using the 'unsure' feature key.
This sequence was generated from part of bacterial clone contigs of
human chromosome 6, constructed by the Sanger Centre Chromosome 6
Mapping Group. Further information can be found at
http://www.sanger.ac.uk/HGP/Chr6
1112D6 is from the library RPCI-5 constructed at the Roswell Park
Cancer Institute by the group of Pieter de Jong. For further

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       NOTE: This is a 'working draft' sequence. It currently consists of 6 contigs. The true order of the pieces is not known and their order in this sequence record is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Insert size: 138000; agarose-fp

The cDNA library to be analyzed within the framework of this project was created using a Botrytis cinerea strain which was grown under conditions of nitrogen deprivation, which is the normal situation for B. cinerea during its development on its host plant. The library was produced in an oriented direction, in the pBSII
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Submitted (01-SEP-1999) Genoscope - Centre National de Sequenoage: CP 5706 91057 EVRY cedex - FRANCE (E-mail: seqref@genoscope.cns.fr-Web: www.genoscope.cns.fr)

1941 HIV envelope protein c
Synthetic p41 gene with p12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The who Lucilia cuprima ecogysteroid receptor, its iragements and related mucleic acid - vectors, transformed cells, ligands and antisense sequences, used as insecticides also in inducible gene therapy systems and for recombinant protein production

For sequences, used as insecticides also in inducible gene therapy systems and for recombinant protein production

Example 2: Fig 4: 50pp: English.

This nucleotide sequence has an open reading frame (ORF) that codes from third instart. Cuprina larvae and converted to converted from third instart. L. outsina larvae and converted to converted from third instart. L. outsina larvae and converted to converted from third instart. L. outsina larvae and converted to convert by the fragment was isolated from third instart. See V60307-09) based on conserved DNA and how to design further primers (see V60307-08) for 3'-RACE to produce a containing the complete ORF. Also claimed are peptides containing the complete ORF. Also claimed are peptides containing the containing the complete of the A/B, C, D, E or F (especially C or E) domains of the edysteroid receptor, nucleic acid encoding them, expression vectors, an inducible expression system, ligands able to bind the receptor or its peptides, and a vector encoding antisense RNA.

The edysteroid receptor, or its C or E domains, vectors ontaining antisense sequences, and vectors in which a gene encoding the edysteroid receptor is inactivated are used as insecticides, particularly against files and specifically. L. cuprima (Australian blowfly, a vector of human and animal diseases)

C particularly used in baits for adult files. Also contemplated is germine transformation of files using a transposon encoding the receptor or its C or E domains. Host cells are used to produce recombinant receptor, and inducible expression systems are used for steroid-responsive expression of other genes, e.g. in gene therapy (where expression will be induced by administration of insect steroid-responsive expression of other genes. e.g. in gene encodin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New Lucilia cuprina ecdysteroid receptor, its fragments and related
                                                                                                                                                                                                                                                             0.2-FEB-1999 (first entry)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 1; Page 372; 2245pp; Japanese.

A single-stranded DNA (or its complementary strand or the corresp.

double-stranded DNA) which comprises one of the 7837 "GS" sequences
given in T19001-T26837 and which is able to hybridise to part of
human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
sequences were obtained from 3'-directed CDNA libraries prepared
from various human tissues; synthesis of cDNA was initiated from the
3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
untranslated sequence is unique to a particular mRNA species,
all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
is constructed so as to reflect accurately the relative abundance of
different mRNAs in the particular tissue from which it was derived.
The appearance frequency of a given GS in a cDNA library can be
determined (esp. using primers and probes derived from the GS
sequences) as a means of diagnosing abnormal cell function or for
recognising different cell types.

Lomprise repeated sequences from protein L which bind

Lomprise repeated sequences from protein L which bind

Lomprise repeated sequences from protein L which bind

Immunoglobulin Kappa 1ight chains. They can be used in protein

analysis, purification procedures and other biochemical processes e.

9. ELISA. The synthetic molecules are of particular advantage if

they are free of regions in protein L which exhibit albumin and cell

wall binding (The repeat regions commencing at nucleotide numbers 1045, 1261, 1483 and 1705).

    New isolated human genes and the secreted polypeptides they encode -

"Seful for diagnosis and treatment of e.g. cancers, neurological

"Gasorders, immune diseases, inflammation or blood disorders

"Inflammation or blood disorders

"Claim 1; Page 195-196; 380pp; English.

"This sequence represents a nucleic acid molecule which encodes a secreted

"This sequence represents a nucleic acid molecule which encodes a secreted

"This sequence represents a nucleic acid molecule which encodes a secreted

"This sequence represents a nucleic acid molecule which encodes a secreted

"This sequence represents to the gene to a human immunoglobulin Fc portion

"The invention relates to 86 novel genes and their fragments (nucleic acid

"The invention relates to 86 novel genes and their fragments (nucleic acid

"Sequences: X04311-X04410; amino acid sequences W78126-W78225) which

"The invention relates to 86 novel genes and their fragments (nucleic acid

"Sequences: X04311-X04410; amino acid sequences W78126-W78225) which

"The invention of gene therapy. Also, pathological conditions

"The invention of gene therapy. Also, pathological conditions are useful for preventing, treating or ameliocating medical conditions

"The invention of gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Based on which tissues are described for each of the 86 polynucleotides, based on which tissues they are most highly expressed in (see X04311 for described
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /*tag* b

PT New isolated plant glycosyltransferase nucleic acids - used to transform plants to alter the properties or composition of cell walls, e.g. for modifying foodstuffs or wood pulp products Claim 8: Fig 1A-C; 66pp; English.

CC This is the nucleotide sequence of clone gt16, which encodes a convel glycosyltransferase (see W90188) of Arabidopsis thallana.

CC novel glycosyltransferase pendentified i.e. gt11 (gma twelve-like and 5 different genes were identified, i.e. gt11 (gma twelve-like constitution obtain the full-length clone. The predicted truncated truncated protein, and 5/RACE was performed using RNA from A. thaliana callus cells to obtain the full-length clone. The predicted protein has the characteristics of a Golgi glycosyltransferase, i.e. a short cytosolic N-terminus, single transmembrane domain, and a larger cytosolic N-terminal domain with conserved cysteines. The plant cytosyltransferases of the invention (see W90188-94) can catalyse cone or more steps in the blosynthasis of complex non-cellulosic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      plant cell wall polysaccharides. They may also catalyse the glycosylation of plant cell wall protein and/or the transfer of saccharide moteties from nucleotide sugar precursors to oligosaccharide precursors. Nucleic acids encoding the glycosyltransferases can be used to transform plants to alter the properties or composition of the cell wall. The plants produced can be used in the preparation of e.g. food or wood pulp products
antibodies e.g. on columns, in diagnostic tests and in assays. may also be used in the production of pharmaceuticals. Sequence 3279 BP; 1505 A; 480~\rm C; 626~\rm G; 668~\rm T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           P-PSDB; W90188.

A computer readable medium has been developed which has recorded on it
Computer readable medium has been developed which has recorded on it
X12938 to X13919 represent these nucleotide sequences which are primary
nucleotide sequences; also known as contigs. The computer-based system
can identify fragments of the Enterococcus faecalis genome with
commercial importance. The products can be used to detect the presence
of Enterococcus faecalis in samples. They can also be used for
configuration of disease, and for identifying agents which can be used to
modulate the growth or pathogenicity of Enterococcus faecalis, or
conclusted organism, in vivo or in vitro. In particular the
polypeptides encoded by the Enterococcus faecalis nucleotide sequences
can be used in vaccines to prevent or attenuate an Enterococcal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI: 99-045171/04.

New isolated Enterococcus faecalis polynucleotides and polypeptides

- used to develop products for the detection of Enterococcus and for use in vaccines for prevention or attenuation of Enterococcus
                                                                                                                                                                                                                                                                                                   Enterococcus faecalis genome contig SEQ ID NO:137.

Claim 1; page 814-819; 1409pp; English.

The present invention describes a computer readable medium which has

The present invention describes a computer readable medium which has

the nucleotide sequences SEO ID No:1 to 391 (V52134 to V52524) recorded

on it, or a representative fragment or a sequence at jeast 95% identical

to SEO ID No: 1 to 391. The nucleotide sequences depicted in SEO ID No:1

to 391 (V52134 to V52524) are genomic fragments from Streptococcus

pneumoniae. The present invention also describes an isolated nucleic acid

molecule encoding a homologue of any of the fragments of the Spneumoniae

comprising; (a) screening a genomic DNA library using as a

probe a target sequence defined by any of the sequences in SEO ID No:1

to 391, identifying members of the library which contain sequences

that hybridise to the target sequence and isolating the nucleic acid

molecules from the members; or (b) isolating mRNA, DNA or CDNA produced

from an organism, amplifying nucleic acid molecules whose nucleotide

sequence is homologous to amplification primers derived from the

sequence is homologous to amplification primers derived from the

isolating the amplified sequences. The computer readable medium can be

sequence of commercial importance, or expression modulating

fragment of the sequences or expression modulating

fragments of the sequences or expression modulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             fragments of the S. pneumoniae genome. Products from the present
invention can be used in diagnosis kits and assays, and pharmaceutical
compositions and vaccines for S. pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                             Computer-readable medium with recorded Streptococcus pneumoniae polynucleotide sequences - useful in diagnostic kits and assays, and pharmaceutical compositions and vaccines for Streptococcus
                                                   Streptococcus pneumoniae genome fragment SEQ ID No:112.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
Cancer susceptibility gene. The nucleic acid molecule can be used to construct probes for screening cDNA or genomic libraries, sequencing construct probes for screening cDNA or genomic libraries, sequencing construct probes for screening cDNA or genomic libraries, sequencing construct probes for screening cDNA or genomic libraries, sequencing construct probes for screening cDNA or genomic libraries, sequencing construct probes for caid molecules and proteins are useful in a method of medical treatment, preferably gene therapy, especially for treating cancer, where the cancer is female or male breast cancer, ovarian, prostate or colorectal cancer, ocular melanoma or latekaemia. In particular antisense oligonucleotides capable of bybridising to the BRCA2 nucleic acid, pre-mRNA or mature mRNA are used to that the expression of the BRCA2 nucleic acid is reduced or prevented. The nucleic acid molecules are also useful in a method for nucleic acid molecules are used to design probes or primers for PCR to determine or detect the presence of mutations in a sample of nucleic caid molecules are used to design probes or primers for PCR to determine or detect the BRCA2 promoter region is useful for screening for substances which modulate the expression of nucleic acid under control of the promoter. Antibodies are used to determine the presence of mutations or properties are used to screen for binding partners, these are used to screen for binding partners, these are used to screen for binding partners, these are used to substances which mimic the activity of BRCA2 customer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              P-PSDB; W25038.
Nucleic acid molecules comprising part or all of the BRCA2 cancer
susceptibility gene - useful for diagnosis, prognosis or therapeutic
                                                                                                                 Partial BRCA2 cancer susceptibility gene. RECA2 cancer susceptibility gene; breast cancer; ovarian cancer; gene therapy; prostate cancer; colorectal cancer; ocular melanoma; leukeemia; human; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1995 T;

T A hepatitis C virus gene and oligo-nucleotide(s) - used for the ratment of hepatitis C (Jaim 1: Pages 10-15; 41pp; Japanese.
Claim 1: Pages 10-15; 41pp; Japanese.
C (J79140 is the hepatitis C virus (HCV) gene HC-G9 cDNA, it encodes the protein described in R67588. Both the cDNA and protein can be used in the treatment of HCV infection

PT We coding sequence haplotypes of the human BRCA2 gene - used to develop products for determining susceptibility to, detection and treatment of breast or ovarian cancer and the products for determining susceptibility to, detection and treatment of breast or ovarian cancer.

The present invention describes genomic DNA which contains a BRCA2 gene where the first 12 nucleotides beginning exon 5 are 5'TCCTGTTGTTCT-3' as in sequence (I) (see X03249), where nucleotides numbers 5782-5790 are GTTGGTGT as in sequence (II) (see X03251), and where the isst 20 nucleotides encoding exon 15 are 5'-CTGGTGTTCTCARAACAG-3' as in sequence (II) (see X03251) and the first 20 nucleotides beginning exon 16 are 5'-CTGTARAGCTARGGGTTCT-3' as in sequence (III) (see X30253).

Products and methods from the present invention can be used for insequence intripying mutations in the BRCA2 gene leading to predisposition or higher susceptibility to breast or ovarian cancer. They can also be used in methods for monitoring disease progression, for determining be used in methods for monitoring disease progression, for determining between the presence or quantifying the amount of a tumour growth inhibitor following such therapy. The BRCA2 protein, polypeptides, their functional equivalents, antibodies, and PNS may also be useful in the study of the characteristics of BRCA2 proteins, such as structure and function of BRCA2 in oncogenesis or subcellular localisation of BRCA2 (omis).

Products in normal and cancerous cells. The present sequence encodes human BRCA2 (omis).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         13.1-UNN-1999 (first entry)

Human BRCA2 (omi3) encoding cDNA.

PW coding sequence haplotypes of the human BRCA2 gene - used to develop products for determining susceptibility to, detection and treatment of breast or ovarian cancer.

PS Claim 13: Page 97-111; 226pp; English.

Claim 13: Page 97-111; 226pp; English.

Che present invention describes genomic DNA which contains a BRCA2 gene where the first 12 nucleotides beginning exon 5 are 5-TCCTGTTGTTGTT as 1n sequence (IV) (see X03249), where nucleotides numbers and where the first 20 nucleotides encoding exon 15 are 5-CTGCTGTTCTCATAAACAG-3' as in sequence (II) (see X03251) and the first 20 nucleotides beginning exon 15 are 5-CTGCTTTCTCATAAACAG-3' as in sequence (III) (see X03251) and the first 20 nucleotides beginning exon 16 are 5'CTGTATAGTAGTGTTGTTG-3' as in sequence (III) (see X03251) and the first 20 nucleotides beginning exon 16 are 5'CTGTATAGTAGTGTTGTTG-3' as in sequence (III) (see X0253).

Crompation and methods from the present invention can be used for identifying mutations in the BRCA2 gene leading to predisposition or confidentifying mutations in the BRCA2 gene leading to predisposition or for detection and gene therapy for breast and ovarian cancers. They can be used in methods for monitoring disease progression, for determining confeccing the presence or quantifying the amount of a tumour growth inhibitor following such therapy. The BRCA2 protein, polypeptides, their confinence or quantifying the amount of a tumour growth inhibitor all equivalents, antiboddes, and PNS may also be useful in the characteristics of BRCA2 proteins, such as structure and cunction of BRCA2 in oncogenesis or subcellular localisation of BRCA2 contains and contains and contains and concerns and 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        21-JUN-1999 (first entry)
Human BRCA2 (om14) encoding cDNA.
Human BRCA2; genetic testing; protein therapy; haplotype; detection; gene therapy; breast cancer; ovarian cancer; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          coding sequence haplotypes of the human BRCA2 gene - used to elop products for determining susceptibility to, detection and

Claim 14; Page 119-133, 228pp; Begilsh.

The present invention describes genomic DNA which contains a BRCA2 gene where the first 12 nucleotides beginning exon 5 are 5'-TCCTGTTGTTCT-3' as in sequence (I) (see X03249), where nucleotides numbers 5782-5790 are GTTTGTTT as in sequence (IV) (see X30255), and where the last 20 nucleotides ancoding exon 15 are 5'-CTGTGTGTTCTGTAAACAG-3' as in sequence (II) (see X30251) and the first 20 nucleotides beginning exon 16 are 5'-CTGTATAGGTTTC-3' as in sequence (II) (see X30253).

Croducts and methods from the present invention can be used for identifying mutations in the BRCA2 gene leading to predisposition or higher susceptibility to breast or ovarian cancer. They can also be used for detection and gene thratapy for breast and ovarian cancers. They can be used in methods for monitoring disease progression, for determining patients suited for gene and protein replacement progression, or for detecting the presence or quantifying the amount of a tumour growth inhibitor following such therapy. The BRCA2 protein, polypeptides, their functional equivalents, antibodies, and PNS may also be useful in the study of the characteristics of BRCA2 proteins, such as structure and function of BRCA2 in oncogenesis or subcellular localisation of BRCA2 contains and sequence encodes buman BRCA2 (onl4).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1964 G;
